User Mobility

- Wireless LANs
- Mobile Devices
- Business Continuity

Campus Security

- Access Control
- Data Protection
- Regulatory Mandates

Imagine...

Imagine a school which doesn't have fixed ICT suites, but instead technology can be used securely by students from any location on campus. Students, faculty, contractors and even guests can have controlled and secure access to the internet, administration or curriculum network whenever they need too.

Imagine a teacher who isn't bound by a desk and a cable, who could be contactable regardless of location on campus and could simply pull up a chair and work from any classroom, staffroom or even outside on a sunny afternoon. Wi-Fi handsets can be used by staff to make FREE calls, text and instant messaging and can even be used to triangulate their location on campus. Home working solutions can also be incorporated as an extension of the schools Wi-Fi network over an IP-Sec tunnel.

Imagine a student who can watch Shakespeare in an English lesson, or stream live IPTV to their laptop in a French lesson. Enhancing the learning environment and providing a stimulating and flexible work ethic is key for keeping students focused and enthused about learning.

Imagine a network manager who isn't spending time 'fire fighting' with network blackouts and downtime in classes, who isn't wasting man hours on internal moves and changes. But instead is focused on the strategy moving forward, reducing costs, and maintaining a reliable and future proofed service.

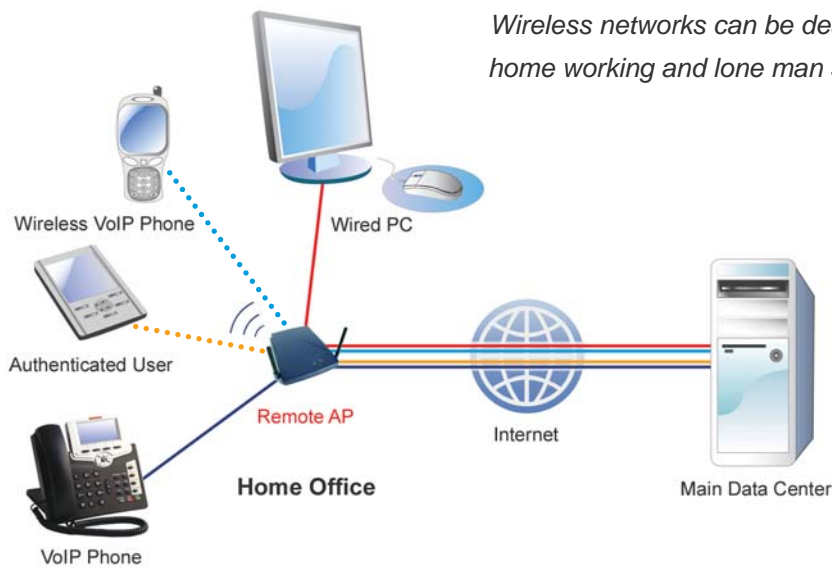

REACT Technologies have been a key partner for over 300 Schools, Colleges and Universities over the last 7 years, helping them understand which wireless technologies are available and best suited to meet their requirements and budget.

Wireless Solutions For Schools

Tel: 01256 301900

Wireless networks can be designed to cover multiple buildings, remote sites, home working and lone man solutions all from a central point of management

We can help you to understand:

- How much a wireless solution would cost?
- How much money you could save?
- What your strategy is moving

Firewalls, Wireless Intrusion Detection and Prevention, Redundancy, Guest Access, Location Tracking, Fixed Mobile Convergence, Security, Integration, Support and Installation, all need to be considered when opting for a Wi-Fi solution.

REACT can guide you through the jargon and explain the points of difference between vendors, which mean you don't have to listen to companies pushing and driving certain products all the time regardless of project requirements. Wireless solutions vary in functionality,

scalability and obviously price. But the most expensive solution isn't always the best suited for your requirements.

We even have a pre RF survey tool which simulates estimated RF coverage; we can then get back to you with an outline proposal and initial pricing.

This is a **FREE** service; all we need is a copy of your floor plans

We also have expertise in the following area:

- Video Conferencing
- Network Access Control
- e-Safety
- Network Mapping
- IP Asset (hardware/software)
- Infrastructure Monitoring
- VoIP
- Virtualisation
